

n_days_to_status2: number of days from initial listing date to candidate's first Status 2 date

STAT2_INIT: date when candidate first reached Status 2

FTIME_NEW: time from first Status 2 to end date (0 days changed to 0.1)

FSTATUS_NEW: event status after reaching Status 2 (0 is censored, and other values represent the competing event types)

- 0 = censored
- 1 = death/deterioration
- 2 = heart transplant
- 3 = recovery
- 4 = upgraded to status 1
- 5 = downgraded to statuses 3-6
- 6 = changed/downgraded to 2999

age_at_status2: estimated candidate age when they first reached Status 2

censor_date_90: date 90 days after candidate first reached Status 2

after_90: indicator variable for whether the original analysis end date occurred after the 90-day censoring date (0 = no, 1 = yes)

status1_before_status2: indicator variable for whether a candidate had Status 1 before first reaching Status 2

- Made this so that if we need to exclude or include these candidates we can easily filter by this

group: indicator variable for whether the candidate started at Status 2 or reached Status 2 later

- 0 = initially listed at Status 2
- 1 = moved to Status 2
